Industrial prescription protective eyewear

Legal requirements

Six areas were considered within the legislation, one of which was personal protective equipment (PPE). The regulations were published under the Health and Safety at Work Act 1974 as Personal Protective Equipment (European Community EC Directive) Regulations 1992 SI 1992/3139.

Eye protection was included in these regulations.

The 1993 regulations apply to all workers in the UK, with the exception for crews of sea-going ships (there is also some debate about the protection afforded to military personnel).

As a result of the publication of these rules all previous legislation was completely revoked. The regulations relating to eye protection are now taken as European Normals ie EN standards.
British, European and International standards are:

- BS EN 166:2002. Personal eye protection: Specifications
- BS EN 169:1992. Personal eye protection: Filters for welding and related techniques: Transmittance requirements and recommended use
- BS EN 170:2002. Personal eye protection: Ultraviolet filters: Transmittance requirements and recommended use
- BS EN 172:1995. Specification for sunglare filters used in personal eye protectors for industrial use
- BS EN 1731:2006. Personal eye protection. Mesh eye and face protectors
- BS EN 14458:2004. Personal eye equipment. Faceshields and visors for use with firefighters' and high performance industrial safety helmets used by firefighters, ambulance and emergency services.
### Types of protective eyewear

**Spectacles, goggles and shields**

As previously stated, all protective eyewear in the UK must conform to the European standard EN 166:2002, which has several differing levels of impact resistance, indicated by symbols.

The range of symbols used in lens type marking are:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Property</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>S</strong></td>
<td>Increased robustness (toughened glass and thickened CR39)</td>
</tr>
<tr>
<td><strong>F</strong></td>
<td>Low energy impact (polycarbonate and Trivex)</td>
</tr>
<tr>
<td><strong>B</strong></td>
<td>Medium energy impact</td>
</tr>
<tr>
<td><strong>A</strong></td>
<td>High energy impact</td>
</tr>
<tr>
<td><strong>9</strong></td>
<td>Non-adherence of molten metal and resistance to penetration of hot solids</td>
</tr>
<tr>
<td><strong>K</strong></td>
<td>Resistance to damage by fine particles</td>
</tr>
<tr>
<td><strong>N</strong></td>
<td>Non-fogging properties</td>
</tr>
</tbody>
</table>

**Note:** When medium energy impact resistance, denoted as EN 166 B, is required or, there is a requirement for protection against electrical arcs, welding materials and corrosive materials, prescription spectacles should not be supplied and goggles, or visors, should be considered, which must carry the appropriate EN specifications.

**Grade B test:** 6mm, 0.86g steel ball travelling at 120 metres per second

When high energy impact resistance (EN 166 A) is required visors or face shields must be supplied.

**Grade A test:** 6mm 0.86g steel ball travelling at 190 metres per second

Low energy impact grade (EN 166 F) is the highest level of impact offered by protective spectacles/glasses.

**Grade F test:** 6mm, 0.86g steel ball travelling at 45 metres per second (polycarbonate and Trivex)

CR39 (with increased thickness) and toughened glass (usually thermally toughened in the UK) are materials offering increased robustness (EN 166 S).

**Grade S test:** 22mm, 43g steel ball travelling at 5.1 metres per second. This is derived from the practical test which is to drop the ball (as stipulated) from a height of 1.3 metres.
Markings required on the lenses of supplied protective spectacles

N ..................... Manufacturer’s mark
1 ..................... Optical class
S or F ............. Impact grade

There will probably also be a Kitemark, which in not a regulatory requirement, but a manufacturer’s stamp of quality.

The Kitemark: is considered the world’s premier symbol of trust, integrity and quality. It indicates that manufacturers carrying the mark have satisfied the most rigorous quality process. The scheme is developed by using BS, EN, ISO or Trade Association specification.

Lens
Marks: The manufacturer’s mark, which is useful as the source is traceable in the event problems, (plus Kitemark), 1 - F or 1- S.

In a number of working environments it may well be possible to only provide appropriate over-goggles, or side shields, to spectacle wearers, but such steps should only be regarded as temporary measures. It should be noted that these measures are not suitable for prolonged or regular use.

Frames
These may be manufactured in metal (often nickel alloys - plated) and plastic (commonly cellulose acetate, polymamide or polycarbonate).

Functionality and use dictates their design, but a range of colours and styles are readily available from the appropriate suppliers.

Frames must also carry the appropriate markings, which are:

Marks: Manufacturer’s mark, again offering traceability (plus Kitemark, not a requirement).

EN 166 ............ Relevant standard.
F ..................... If the frame claims to meet low energy impact (no markings are required for Grade S increased robustness).

CE mark ....... Products must meet legal requirements before they can be sold within the European Community, and must carry CE marking. CE marking attached to a product is a manufacturer’s claim that it meets all the requirements of European legislation.

**Reference**
Standards for eye and face protection

General

BS EN 166:2002 - Personal eye protection - specifications
Not all types of eye protector are permitted to meet all these requirements.

The order of markings on oculars, where relevant, is:
- Scale number (filters only)
- Manufacturer’s mark
- Optical class
- Mechanical strength
- Fields of use
- Scratch resistance
- Resistance to fogging
- Radiant heat

The order of markings on frames, where relevant, is:
- Manufacturer’s mark
- EN166
- Fields of use
- Mechanical strength

Scale number - for oculars with filtering effect only. Higher numbers have a stronger filtering effect (eg are darker for welding). Scale number consists of a code number and a shade number separated by a hyphen, except for welding filters which have no code number. For example, an IR filter with shade number 4 has the scale number 4-4.

Welding filters - see BS EN 169 and BS EN 379
Shade number between 1.2 and 16. Suffix a denotes filter for use in gas welding with flux.

UV filters - see BS EN 170
2- or 3- minus code number denoting UV filter without or with good colour recognition respectively, plus shade number between 1.2 and 5.

IR filters - see BS EN 171
4- minus code number for IR filters, plus shade number between 1.2 and 10.

Sunglare - see BS EN 172
5- or 6- minus code number for sunglare filters without or with IR specification respectively, plus: shade number between 1.1 and 4.1 and BS EN 1836.

Optical class
1, 2 or 3 - indicates optical quality of the ocular. Class 1 is the best.
**Mechanical strength - marked on frames and/or oculars**

<table>

</thead>
<tbody>
<tr>
<td>3</td>
<td>Resistant to liquid droplets (goggles), or liquid splashes (faceshields, but not mesh)</td>
</tr>
<tr>
<td>4</td>
<td>Resistant to coarse dust particles</td>
</tr>
<tr>
<td>5</td>
<td>Resistant to gas and fine dust particles</td>
</tr>
<tr>
<td>9</td>
<td>Resistant to molten metals and hot solids</td>
</tr>
<tr>
<td>G</td>
<td>Resistant to radiant heat (BS EN 1731 faceshields only)</td>
</tr>
</tbody>
</table>

### Other ocular markings

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Property</th>
</tr>
</thead>
<tbody>
<tr>
<td>K</td>
<td>Resistant to surface damage by fine particles</td>
</tr>
<tr>
<td>N</td>
<td>Resistant to fogging</td>
</tr>
<tr>
<td>G</td>
<td>Resistant to radiant heat (BS EN 1731 faceshields only)</td>
</tr>
</tbody>
</table>

**BS EN 1731:2006. Personal eye protection.**

**Mesh eye and face protectors**

**Note:** The requirements and markings for radiant heat, which appear in BS EN 1731:1998, have been deleted from this standard.

The order of markings (following EN166), where applicable, is:

- Manufacturer's mark
- BS EN 1731:2006
- Mechanical strength

**Mechanical strength:** S, F, B or A - as for BS EN 166
Fire fighters and emergency teams

BS EN 14458:2004 - Faceshields and visors for fire fighters, ambulance and emergency services

symbol    property

=          general (non-fire fighting) use
+
          fire fighters' use
○         face guard, or eye guard

Options: Scale number appropriate to filtering performance (see EN 166)

Temperature extremes of testing

symbol    property

T          resistance to medium energy impact at extremes of temperature
A          resistance to high energy impact
AT         resistance to high energy impact at extremes of temperature
K          resistance to abrasion

N          resistance to fogging
R          enhanced infrared reflection
Ω          electrical properties

Sport

BS EN 174:2001 - Ski goggles for downhill skiing
Filtering oculars marked according to transmittance:
S# - in range S0 to S4. Higher number indicates lower transmittance

BS 7930-1:1998 - Eye protectors for racket sports - Squash Oculars
The order of other markings is:
• manufacturer identification
• standard number (BS 7930-1)

Frames
The order of other markings is:
• manufacturer identification
• standard number (BS 7930-1)
• model size if applicable
Assessment of required protective eyewear

Health and Safety at Work Regulations require the employer to identify and evaluate workplace risk. This is commonly undertaken by the company safety officer. The reason for this is that in order to do a comprehensive assessment, someone with access to, and familiarity with, the working environment is essential. This effectively means that a practice-based optician is not the appropriate person to assess such risk, though they may well dispense the required protective eyewear.

The net result of this is that the patient will come into the practice with a ‘Company' order form. This will stipulate the type of lens and lens material required. 

Note: If this is not stipulated contact the company health and safety officer before proceeding. The frame may also be specified though, frequently, a choice is offered to the patient from a stipulated range.

On occasions, however, a self-employed tradesman may come into the practice requiring protective eyewear. In this instance the optician should perform a detailed assessment of the patient's requirements and the type of hazards that are associated with their day to day work. If it is feasible contact a local company involved in the same, or very similar, work type. Alternatively the optician should contact a supplier involved in the supply of protective eyewear to seek their advice. However when the optician proceeds, he/she should keep detailed case records of the reasons for their choice of lenses and frames supplied.

Once an order has been established the spectacles must be ordered from a recognised safety eyewear manufacturer. This will ensure that the necessary standards are met and that a proper safety certificate is issued at the time of completion.

The norm when ‘Company' safety spectacles are being supplied is that the optician will receive a fee for the dispensing service. There are no specific amounts established for the dispensing service so this should be agreed with the supplier before proceeding.
Care of protective eyewear

Not all responsibility lies with the employer. The wearer has obligations to wear the protective eyewear when required and in the manner that they were issued for. The wearer, or another party, must not interfere with, abuse, or alter the appliance in any way.

Advice on the proper care of the appliance should be given (how to clean and the benefits of putting into the case provided when not in use). Remember the hazards of cleaning polycarbonate lenses with acetone or methyl chloride!

Avoid extreme heat (unless specifically designed for such use) and humidity.

*It is very important that the optician is aware of the very limited actions that they can perform with regard to protective eyewear; effectively this is limited to adjustment only. The optician must never undertake any repair - even replacing a screw. Such action would invalidate the protection guarantee. All repairs must be returned to the original supplier who will, when completed, issue a new guarantee certificate.*
Sunglass protection

Sunglass tints will reduce light transmission, but should offer 100% protection from UV radiation (specifically UVA - possible cataract formation, retinal damage with long term exposure; UVB - potentially the most hazardous, as this can damage the retina and the conjunctiva, the worst scenario being blindness; UVC - does not reach the earth surface as it is absorbed by dioxygen ie the ozone layer).

In hot conditions/climates, it might be advisable to give infrared protection:

- **Infrared A** (wavelength between 780 and 1400 nanometres) is dangerous to the retina

- **Infrared B** (wavelength between 1400 and 3000 nanometres) can cause damage to the cornea, iris and the lens

- **Infrared C** (wavelength between 3000 and 1 million nanometres) can cause damage to the cornea

BS EN 1836 is for sunglasses with a plano prescription for general use - including driving. This standard does not cover prescription or industrial sunglare filters.

Labelling and information should include:

1. Identification of manufacturer
2. Filter category number (see below)
3. Number and year of standard (ie BS EN 1836:2005)
4. With category 4 filters a warning ‘not suitable for driving or road use’ (symbol: a car with a line through it)
5. Additional information drawn up and kept by the manufacturer:
   a) Manufacturer’s name and address
   b) Type of filter
   c) Instructions for cleaning and use
   d) Explanation of markings
   e) Optical class
   f) Plano sunglasses must be CE marked against the PPE Directive

Filter categories and descriptions

See table on opposite page

**Note:** The latest annex to this standard (2007:E2) states that ‘Sunglare filters with an LTF of less than 75% are not suitable for use in twilight or night driving and road use’, this overlaps somewhat with the filter categories, but, nevertheless is the most up to date directive. The best advice should be for no tinting to the lens, but an
MAR coat should be a must (perhaps a gold reflex, an arguable aid to contrast). For users working long hours under fluorescent lighting, a blue reflex may be helpful to counter the tiny amount of UV emitted from this type of lighting.

- Driving and road use - Filters suitable for daylight are: 0, 1, 2 and 3
- Filters from 1 - 4 are not suitable for night driving and road use
- Filter category 4 not suitable for driving or road use per se

Though the above filter categories refer to plano sunglasses the information is also very relevant to prescription sunglass wear.

**Other specialist sun protection lenses**

**Polycarbonate**
Where safety or wrap around types are required polycarbonate is commonly used (polycarbonate, in white form, eliminates 100% of UV @ 380nm).

**Polarised lenses**
Which are the only truly anti-glare lenses, should be recommend for use on and around water (fishing, sailing, water skiing etc). For prolonged wear, there is a very valid argument for the addition of a mirror coating, to counteract the increased UV being reflected from the water. It is also a very good driving/road use tint, especially in wet conditions on a bright/sunny day. Consideration should also be given to ‘DriveWear’ lenses (for daytime use only), which combine photochromic technology with polarisation.
Sun glass protection
Continued

Snow Skiing
Commonly supplied in goggle form and where a prescription is required inserts may be used.

For general use, grey tints should be suggested - grey reduces the Visible Light Transmission (VLT) across the spectrum. Polarised lenses may also be used under these conditions, but these tend to mask small contours on the slope. In sunny conditions darker brown tints may be used. For overcast, flat light days, in which there is an over-abundance of blue light, yellow or rose tints may be used. VLT may also be further reduced by the use of mirror coatings, importantly this coating will also ‘reflect’ the added UV radiation which is exacerbated by reflection from the snow.

Shooting / archery
A bronze tint should be used for skeet, clay-pigeon and trap shooting. It is also the tint of choice for hunting.

For black on white target shooting yellow (sodium) tints offer good contrast. However, targets may vary in colour. For orange targets use an orange tint. Red and pink tints are good for black and green targets and are also effective on orange targets and for hunting; they also reduce the effects of a green background, grass, trees and shrubs. A red tint can improve colour differentiation for people with a colour vision problem.

Tints should not be too dark, as this results in an enlarged pupil, which can adversely affect the shooters'/archers' performance. Compare it to the pinhole effect, which sharpens the image.
Cricket
Tints will vary according to the light conditions, but the purpose is mainly to enhance contrast. The spectacles are mostly wrap around and will benefit from a mirror coating (cricketers spend prolonged periods in the field increasing UV exposure).

Tropical/desert use
According to BS EN ISO Standards, solar radiation on the ground, even under extreme illuminance conditions, poses no risk to the ocular tissues. Prolonged exposure in desert environments may, however, pose some risk according to some scientists. Protection from infrared is achieved by the use of ferrous oxide in the glass lens mix, eg Rayban G15. However, as the G15 is a solid glass tint differing thicknesses in the lens will result in an uneven tint. This can be addressed with bonded/equitint forms.

Photochromic lenses
Should be recommended for patients who are generally light sensitive, who like a flexibility in their tint, or for pathological/genetic conditions, such as albinism.
Sports and home protection

Note: This is only a brief resumé of this ever expanding field.

DIY
The DIY amateur is just as vulnerable to accident as the professional, arguably more so. He/she should be encouraged to have the necessary eye protection. Hazards may include flying particles, dust, chemical compounds (ammonia, acids, super glue). Is it surprising that there are more accidents in the home than at work? The emmetrope should wear wrap around goggles (injection moulded polycarbonate). The spectacle wearer should at least have some form of over protection.

Hard ball and racket sports
For ‘hard’ ball and racket sports impact resistance is the prime concern. Hard resin CR39 may be used, but to be extra safe think in terms of polycarbonate or Trivex.

Squash
Squash has a particular hazard, as the squash ball is just the right size to fit into the eye orbit, which literally explodes on impact! All squash players should have eye protection. There are specifically designed goggles for squash use which must be fitted with the most efficient impact resistant lenses.
Swimming goggles
Poor vision and the salt or chlorine in water can make swimming an uncomfortable experience. Plano swimming goggles are available, as are ready wear prescription goggles, incorporating basic spherical lens powers, or goggles with the patient’s accurate prescription incorporated. Impact resistance is a consideration, though CR39 material should be adequate.

Diving (scuba and snorkeling)
Safety is a very important factor, hence normally a face mask is supplied (a firm water-tight fit is essential). Plano masks are available; for prescription use masks with inserts may be used or the prescription lens may be stuck/cemented to the rear surface of the mask (accurate centration is very important).

Cycling
Cycling has many facets to consider when supplying the protective unit, which are most commonly supplied in goggle form because this offers good all round protection. These are obtainable in plano form and as goggles which are fitted with prescription inserts or as prescription lens goggles using freeform technology. The tint choice is an important factor from the light transmission to UV protection to contrast requirements. Protection from wind, dust and impact are also essential. Vitally important is a firm and stable fit.

Football
Attention should be drawn to the ABDO ‘Children’s eye protection in football’ publication, a guide for referees, coaches and parents. This is available upon application and is free to ABDO members.

These are just some of the areas in which opticians should become more actively involved. However, with responsibility comes liability, so always keep detailed practice records, even when supplying non-prescription units.
